

Cold Email — Domain & Inbox Health Monitor

How the system watches your sending setup, so you don't have to. Prepared 2026-06-27.

The promise: a small program checks your entire email-sending setup **once every morning** and stays completely silent. You only hear from it when something actually breaks or changes — and then it emails you the exact item to look at. No dashboards to check, no daily noise. If your inbox is quiet, your sending is healthy.

1 What it checks — every domain and every inbox

Domain “ID papers” (SPF & DMARC)

These DNS records prove your email is really from you and not a forger. **If one breaks, Gmail/Outlook start sending you to spam.**

Mail routing (MX & NS)

Confirms the mail servers and nameservers behind each domain haven't silently changed. **Catches a provider switch before it hurts delivery.**

Spam blacklist (Spamhaus)

Checks each sending domain isn't flagged on the industry's main spam blacklist. **Being listed tanks deliverability everywhere at once.**

Inbox warmup & status

Each mailbox has a warmup health score; flags any that drop below 90, or any account that disconnects. **Low warmup = land in spam.**

2 How it decides whether to bother you

Check & remember

Every morning it records the full state of all domains and inboxes as a “baseline.”

Compare to yesterday

It compares today against that baseline — looking only for things that are *newly* broken or *changed* (a DNS record edited, a domain newly blacklisted, a warmup score that fell).

Stay silent or alert

All clear → it says nothing. Something new → it emails you. Known issues that haven't changed don't re-nag you.

3 What happens when something's wrong

It emails **theodore@franchisesellers.com** with a short, plain list of exactly what needs a look — which domain or which mailbox, and what changed. Nothing else to dig through. A typical subject line:

⚠ Cold email health: 2 issue(s)

Example items: “acme-outreach.com: DMARC record missing” · “jane@acme-mail.com: warmup score 82 (below 90)” · “acme-mail.com: newly listed on Spamhaus blacklist.”

4 What it's watching right now

ALL-CLEAR TODAY

5 It's also a safety brake, not just an alarm

The monitor writes a daily health file that the **pre-send safety gate** reads before any campaign goes out. If the sending domains aren't healthy, the gate **blocks the send** on its own. So this isn't only a heads-up email — it's wired in as an automatic interlock that won't let mail leave on a broken setup.

6 What you need to do

Day to day: nothing. No login, no checking. If you ever get an alert email, it names the exact domain or mailbox and the problem — most fixes are a quick change in Instantly (reconnect a mailbox) or at the domain registrar (a DNS record), and I can handle the fix when it comes up.

Runs on the production droplet as a daily scheduled job (zero new software, no added cost). Built from your existing monitoring + alert patterns. Checks: SPF / DMARC / MX / NS per domain · Spamhaus DBL blocklist · Instantly warmup score & account status per mailbox · alerts via Resend, anomaly-only.

silent unless action needed
